Neck metastases from unknown primary (cT0)

General remarks

1. Metastatic cervical adenopathy of unknown primary origin represents a very heterogeneous entity. Squamous cell carcinoma is the more frequent histological type, followed by adenocarcinoma and undifferentiated carcinoma. If melanoma, lymphoma, adenocarcinoma (usually chest but also thyroid and salivary) treat accordingly; here we consider only SCC or undifferentiated carcinoma;
2. Some associations between the location of the node and the primary site: superficial parotid: skin; level Ib: oral cavity; level II-Va: NPC; level IV: chest (or abdomen)
3. Work up:
