Radioterapia stereotassica body nel paziente oligometastatico

Mario Santarelli
UOC Radioterapia Rieti

Stereotactic body radiotherapy for oligometastases

Alison C Tree, Vincent S Khoq, Rosalind A Eeles, Merina Ahmed, David P Dearnaley, Maria A Hawkins, Robert A Huddart, Christopher M Nutting, Peter J Ostler, Nicholas J van As

“The role of radiotherapy in the management of metastatic disease has been mainly limited to palliation, but we now have an opportunity to challenge this idea...”

La incidenza della **diffusione metastatica limitata** non è stata ben studiata ma svariati dati suggeriscono che sia nota e frequente specie per alcuni tipi di tumori:

- Polmone
 - Mammella
 - Colon-retto
 - Sarcomi
- 

Nuove tecniche di imaging

Il miglioramento delle tecniche di imaging e del loro appropriato uso evidenzia in percentuale sempre superiore la presenza di metastasi asintomatiche

Aumento della percentuale di evidenza di condizione di malattia oligometastatica

Barney JD, Churchill EJ: Adenocarcinoma of the kidney with metastasis to the lung cured by nephrectomy and lobectomy. J Urol 42:269-276, 1939

Caso di carcinoma renale con una metastasi
al polmone trattato con nefrectomia e lobectomia.
Il paziente muore dopo 23 anni senza recidiva
di malattia

Table 1. Summary of Surgical Metastasectomy and SBRT for Metastasis Therapy to Multiple Sites

Surgical Series	Year	No. of Patients	5-Year Survival (%)	10-Year Survival (%)	Site
Rees et al (colorectal cancer)	2008	929	36 ^a	23 ^a	Liver

serie chirurgiche hanno riportato ***favorevoli outcome clinici*** in pazienti con limitata estensione di malattia al fegato, polmone, surrenali e *cervello* ***evidenziando che una parte di pazienti con malattia limitata può essere curata con buone prospettive di risultato***

Outcomes after Resection of Synchronous or Metachronous Hepatic and Pulmonary Colorectal Metastases

2007

George Miller, MD, Peter Biernacki, BS, Nancy E Kemeny, MD, Mithat Gonen, PhD, Robert Downey, MD, FACS, William R Jarnagin, MD, FACS, Michael D'Angelica, MD, FACS, Yuman Fong, MD, FACS, Leslie H Blumgart, MD, FACS, Ronald P DeMatteo, MD, FACS

rates of 36% to 45%.⁹⁻¹² But the role of surgery in the management of patients who have both liver and lung metastases (either at the same or different times) is not well defined. In fact, development of both hepatic and pulmonary colorectal metastases is commonly regarded as an indicator of widespread tumor dissemination, and surgery is generally considered futile.

Unfortunately the benefits of resection and appropriate *selection criteria* in patients who develop metastasis are still poorly defined.

Radioterapia Stereotassica body

Perché SBRT ?

Motivo n° 1 un intervento radicale essere erogato durante una fase oligometastatica, potrebbe **modificare la progressione della malattia** nei pazienti che altrimenti sarebbero stati trattati palliativamente nella maggior parte dei casi

Motivo n° 2 Ritardare i successivi trattamenti

Motivo n° 3 La **corretta identificazione di un subset di pazienti oligometastatici** in cui la conseguente terapia ablativa consente **di modificare significativamente gli outcome clinici**

Radioterapia Stereotassica body

La SBRT di metastasi limitate ha mostrato promettenti tassi di **controllo locale** che vanno dal **65%** ed il **96%**

Le **OS a 2 o 3 anni** riportate nelle varie casistiche sono comprese tra il **30%** ed il **64%** risultate comparabili con i dati della chirurgia .

La SBRT:

- Meno invasiva
- Può essere applicata ad un più largo numero di tumori, organi e sedi
- Sedi meno accessibili alla chirurgia
- A pazienti unfit per la chirurgia
- Meno costosa

Studi retrospettivi

Radioterapia Stereotassica body

Table 2. Selected Ongoing Prospective Trials for Oligometastases

Trial Name or Number	Design	Eligibility	Intervention
SABR-COMET	Randomized	All metastatic sites treatable; maximum of three tumors to any single organ system; controlled primary tumor	Standard arm: palliative-scheme radiation; experimental arm: stereotactic ablative radiation
UPCI 10-028	Phase II	≤ Five metastases from solid malignancy	SBRT to affected sites
UPCI 10-027	Phase II	≤ Five metastases diagnosed at initial presentation	SBRT to affected sites in combination with treatment of primary tumor
NCT01565837	Phase II	Melanoma with ≤ five metastatic sites (not resectable)	Ipilimumab with SBRT to all sites, timed to be delivered before third cycle
NCT01185639	Phase II	NSCLC with ≤ five metastatic sites, involving lung, liver, adrenal, or spinal lesions; if primary untreated, must have ≤ three	SBRT to affected sites, delivered in three or five fractions
PulMiCC	Randomized	Pulmonary metastases from colorectal cancer	Standard: active monitoring; experimental: active monitoring with pulmonary metastasectomy

Abbreviations: NSCLC, non-small-cell lung cancer; PulMiCC, Pulmonary Metastasectomy in Colorectal Cancer; SABR-COMET, Stereotactic Ablative Radiotherapy for Comprehensive Treatment of Oligometastatic Tumors; SBRT, stereotactic body radiotherapy; UPCI, University of Pittsburgh Cancer Institute.

SBRT Linac-based

Trilogy

Vero

Cyberknife

Tomotherapy

SBRT: LINAC dedicato o modificato?

- ▶ Aumenta le applicazioni del LINAC con maggiore focalizzazione e precisione spaziale

SBRT

I miglioramenti high tech sono riferiti all'affinamento dell'*approccio balistico*:

- . intensità modulata comprendente arcoterapia ed approcci rotazionali
- . possibilità di target multipli
- . bracci robotici CyberKnife Robotic Radiosurgery
 - ▶ Dosi sempre più alte al target ed in poche sedute
 - ▶ $GTV = CTV$ $PTV = GTV + \text{margine millimetrico}$
 - ▶ Dosi sempre più basse ai tessuti sani
 - ▶ Effetti accettabili sulle strutture critiche

Radioterapia Stereotassica body

Approccio tecnico

- ✓ Miglioramento della fase di identificazione dei contorni della lesione
- ✓ adeguata immobilizzazione e riposizionamento del paziente
- ✓ corretta collocazione del volume da trattare nei 3 assi dello spazio (fiducials, body-frame, riflettori optoelettronici, OBI , cone beam CT etc.)
- ✓ adeguato controllo della organ motion respiratoria per la massima riduzione dei margini interni.

Controllo del Respiratory Motion

Dampening or inhibitory techniques

La *compressione addominale obbliga il paziente ad usare solo la gabbia toracica per respirare*, con conseguente riduzione del movimento complessivo intratoracico

Vantaggi: semplice, nessuna pausa nell'erogazione della RT, non necessita di particolari tecnologie, è la tecnica più usata

Svantaggi: discomfort per il pz., non estremamente preciso (escursioni del target anche di 0.5-1 cm)

Controllo del Respiratory Motion

L' **active breath control (ABC)**,

è un' altra forma di ***inibizione del respiro, ma controllata dal pz. stesso***. Il trattamento viene erogato solo durante alcune fasi del respiro del paziente (ispirazione, fase del respiro in cui il polmone è più stirato e quindi il tessuto sano è più lontano)

Svantaggi: training del paziente, allungamento dei tempi di RT

Controllo del Respiratory Motion

Gating systems

➤ La macchina seguendo il ciclo respiratorio del paziente, eroga RT in genere **in espirazione** (fase più lunga del ciclo), e si ferma quando il pz. inspira.

Vantaggi: maggiore compliance e confort per il pz.

Svantaggi: allungamento dei tempi, maggior rischio di tox per tessuti sani (< stiramento polmone con < distanza tumore/tessuti sani).

Beam Off

Beam On

Beam On

Beam Off

Riposizionamento automatico

Controllo del Respiratory Motion

Tracking systems

Prevedono la possibilità che il fascio possa seguire continuamente il target nel suo movimento, ad esempio come fa **cyberknife o Vero** , o attraverso un **collimatore dinamico** che modifica continuamente la posizione delle lamelle.

Vantaggi: erogazione continua di RT

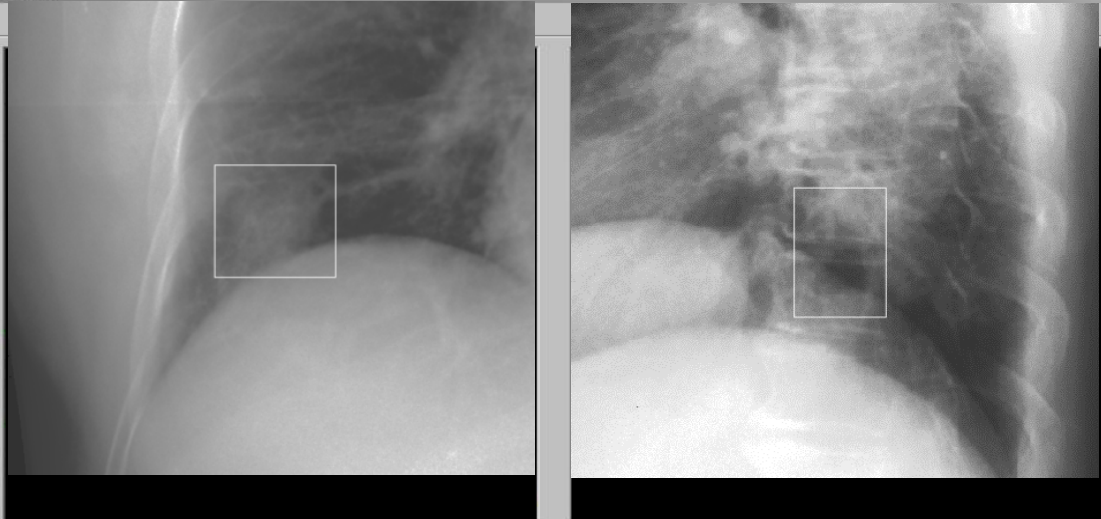

Svantaggi: rischio di movimenti incontrollati e di “ritardi” della macchina nel seguire il target.

DYNAMIC TUMOR TRACKING

Radioterapia Stereotassica body

Fattori che influenzano il controllo locale ,PFS ed OS

Tossicità dei trattamenti

SRBT : Fattori che influenzano il controllo locale ,PFS ed OS

1) Numero delle metastasi

1 a 3 metastasi	9 mesi	Miglior PFS	46% ulteriore diffusione metastatica
4 o 5 metastasi		Peggior PFS	75% ulteriore diffusione metastatica

Salama et al Cancer 2011

[Cancer](#). 2012 Jun 1;118(11):2962-70. doi: 10.1002/cncr.26611. Epub 2011 Oct 21.

Stereotactic body radiotherapy for multisite extracranial oligometastases: final report of a dose escalation trial in patients with 1 to 5 sites of metastatic disease.

Salama JK, Hasselle MD, Chmura SJ, Malik R, Mehta N, Yenice KM, Villaflor VM, Stadler WM, Hoffman PC, Cohen EE, Connell PP, Haraf DJ, Vokes EE, Hellman S, Weichselbaum RR.

2) Istologia

Breast cancer

PFS a 2 aa	36% vs 13%	altri tumori
OS a 6 aa	49% vs 9%	altri tumori
LC a	87% vs 74%	altri tumori

Milano et al IJROBP 2012

882 Milano et al.

Fig. 1. Kaplan-Meier actuarial (A) overall survival and (B) freedom from distant progression for breast cancer (red line) and nonbreast cancer (blue line) patients. A color version of this figure is available at www.redjournals.com.

SRBT : Fattori che influenzano il controllo locale ,PFS ed OS

3) Sede

Una revisione retrospettiva di pazienti con **metastasi confinata a un organo** ha dimostrato che quelle **ossee** o **linfonodali toraciche** hanno una migliore sopravvivenza di quelle polmonari o epatiche, e che tendono anche ad avere una migliore sopravvivenza libera da progressione.

Milano MT et al AJCO 2010

➤ **La sede più o meno critica della metastasi** condiziona a volte il risultato terapeutico condizionando la possibilità di erogare dosi elevate

4) Disease-free interval

Se tempo della recidiva	> 12 mesi	OS a 3 aa	53%
	< 12 mesi	OS	19%

Inoue et al Jpns JCO 2010

Se DFS > 12 mesi OS superiore HR 0.51, 95%

Zhang et al Chin Med J 2011

SRBT : Fattori che influenzano il controllo locale ,PFS ed OS

5) Diametro

Il diametro della metastasi è predittivo del controllo “ in field “

Choi et al IJROBP 2009

Il controllo in field è inversamente proporzionale al diametro della metastasi

Milano et al IJROBP 2012

Metastasi epatiche

< 3 cm controllo del 100% a 2 anni

➤ 3 cm controllo del 77%

Rusthoven et al JCO 2009

6) Dose e Volumi di contornazione

Diversi Modelli investigativi

Dosi e frazioni differenti per organi ed apparati differenti

SRBT : Fattori che influenzano il controllo locale ,PFS ed OS

5) Diametro

Il diametro della metastasi è predittivo del controllo “ in field “

Choi et al IJROBP

2009

Il controllo in field è inversamente proporzionale al diametro della metastasi

Milano et al IJROBP 2012

Metastasi epatiche

< 3 cm controllo del 100% a 2 anni

> 3 cm controllo del 77%

Rusthoven et al JCO

2009

6) Dose e Volumi e metodi di contornazione e finalità

Il CTV della SBRT è in genere diverso (minore) rispetto alla 3D-CRT

Es: metastasi vertebrale

Perché fare SBRT e non 3D?

- Dose ablativa e non palliazione (malattia non diffusa)
- Metastasi da primitivo radioresistente
- Malattia confinata ad una parte della vertebra
- Pregressa chemioterapia (mielotossicità)
- Reirradiazione

Tecnica d'irradiazione

7) Timing ?

RESEARCH

Open Access

A single-institution study of stereotactic body radiotherapy for patients with unresectable visceral pulmonary or hepatic oligometastases

Ingrid Fumagalli¹, Jean-Emmanuel Bibault¹, Sylvain Dewas¹, Andrew Kramar², Xavier Mirabel¹, Bernard Prevost¹, Thomas Lacomberie¹, Haier Jerrava³ and Eric Lartigau^{1*}

SBRT and previous chemotherapy regimens

We wondered whether or not pre-treated patients with metastatic disease could benefit from SBRT. Most of our patients had received prior chemotherapy (91%), with a high number of chemotherapy regimens, 27% of them receiving more than three regimens, which may have increased the radioresistance of the metastases. We found that a patient's history of prior chemotherapy was a major risk factor in recurrence outside the treatment volume (HR = 4.51, 95% CI: 1.10–18.47, p = 0.007). Also, the number of previous chemotherapy regimens

SRBT : Fattori che influenzano il controllo locale ,PFS ed OS

7) SBRT e CHT: timing ?

Fumagalli et al. *Radiation Oncology* 2012, 7:164
<http://www.ro-journal.com/content/7/1/164>

RESEARCH

Open Access

A single-institution study of stereotactic body radiotherapy for patients with unresectable visceral pulmonary or hepatic oligometastases

administered or progression while receiving chemotherapy significantly correlates with a higher risk of failure. One hypothesis that could explain this finding could be that the previous chemotherapy regimens, received by the patients, selected tumoral clones with a lower sensitivity to radiation, even if no study has been published to prove it. This suggests that SBRT should perhaps be used as a local treatment for metastases before the administration of several systemic therapies.

2012

BRIEF REPORT

Immunologic Correlates of the Abscopal Effect in a Patient with Melanoma

THE ABS COPAL EFFECT REFERS TO A RARE PHENOMENON OF TUMOR REGRESSION at a site distant from the primary site of radiotherapy.¹ Localized radiotherapy has been shown to induce abscopal effects in several types of cancer, including melanoma, lymphoma, and renal-cell carcinoma.²⁻⁴ The biologic characteristics underlying this effect are not completely understood, but it may be mediated by immunologic mechanisms.⁵

Original article

Central thoracic lesions treated with hypofractionated stereotactic body radiotherapy

Michael T. Milano *, Yuhchyan Chen, Alan W. Katz, Abraham Philip, Michael C. Schell, Paul Okunieff

Department of Radiation Oncology, University of Rochester Medical Center, NY, USA

Institution	Patient population	Prescribed dose (Gy)	Fraction dose (Gy)	BED2 (Gy)	Toxicity
IndianaU.	Stage I NSCLC	60-66	20-22	219-258	11-Fold increase risk of severe-fatal toxicity
Hokkaido U	NSCLC and Mts	48	6	64	1 of 9 with severe toxicity
U. Texas, San Antonio	NSCLC and Mts	36	6-12	86-126	1 of 9 – asymptomatic airway collapse
Air Force General Hospital	Stage I-II NSCLC	60-70 40-50	6-7 4-5	120-167	No severe toxicity
VU Amsterdam	Stage I NSCLC	60	7.5	88	No severe toxicity
Technical U.	NSCLC and Mts	35	7	105	No severe toxicity

Moderately hypofractionated SBRT to central thoracic lesions is effective with respect to local control and toxicity.

| ▶ Diffuse ground glass opacities
(more than 5 cm of GGO) | 4-8% |
| ▶ Patchy ground glass opacities
(less than 5 cm of GGO) | 10-15% |

Diffuse ground glass opacities

Tossicità polmonari precoci dopo RT

Le alterazioni visibili alla TC dopo SBRT o 3D sono differenti rispetto alla radioterapia convenzionale . Differiscono in:

- 1) Caratteristiche morfologiche
- 2) Estensione
- 3) Distribuzione

3D focale o nodulare opacità vetro smerigliato aree di consolidazione o entrambe con *reperti situati immediatamente intorno al tumore trattato*
In altri casi i reperti radiologici *possono essere localizzati al di fuori del target*, anche se confinati all' interno del campo di irradiazione

SBRT Le alterazioni radiologiche sono visibili *solo all' interno del target* a causa dell' alto gradiente di dose

Radiation Injury After Hypofractionated Stereotactic Radiotherapy for Peripheral Small Lung Tumors: Serial Changes on CT

Radiation Injury of the Lung After Three-Dimensional Conformal Radiation Therapy

Titus R. Koenig¹

OBJECTIVE. The objective of this study is to describe the CT patterns of radiation injury in the

Fibrosi radioindotta

- **Modified conventional pattern**

- Mass-like pattern
- Scar-like pattern

- **Opacità a margini netti**

- **Perdita di volume**

- **Bronchiectasie da trazione**

- **Minore estensione rispetto alla RT convenzionale**

- **Può modificarsi la localizzazione nel primo anno di comparsa con dislocazione verso l' ilo o lontano dall' ilo**

Fig. 3.—Modified conventional pattern in 81-year-old man with squamous cell carcinoma.
A. Pretreatment CT scan shows cavitary mass in left lower lobe.
B. CT scan obtained 10 months after completion of radiation therapy shows decrease in size of mass and development of consolidation indicating organizing fibrosis.
C. CT scan obtained 22 months after completion of radiation therapy shows well-defined area (arrows) of consolidation, volume loss, and traction bronchiectasis typical of radiation fibrosis. Note lung anterior to fibrosis is normal.

2002

Radiation Injury of the Lung After Three-Dimensional Conformal Radiation Therapy

Titus R. Koenig¹

OBJECTIVE. The objective of this study is to describe the CT patterns of radiation injury in the

Fibrosi radioindotta

- Modified conventional pattern
- Mass-like pattern
- Scar-like pattern

Fig. 4.—Masslike pattern in 44-year-old woman with adenoid cystic carcinoma. Note right pneumonectomy. A, Pretreatment CT scan shows well-circumscribed mass (arrow) in left lower lobe. B, CT scan obtained 21 months after completion of radiation therapy shows consolidation and bronchiectasis at tumor site that resembles mass.

- Aree di consolidazione focale situata **2 cm** oltre il tumore
- Corrisponde alla zona con più alta dose
- Può modificarsi la localizzazione nel primo anno di comparsa con dislocazione verso l'ilo o lontano dall'ilo

TOSSICITA' Modificazioni radiologiche tardive

Radiation Injury of the Lung After Three-Dimensional Conformal Radiation Therapy

Titus R. Koenig¹

OBJECTIVE. The objective of this study is to describe the CT patterns of radiation injury in the

Fibrosi radioindotta

- Modified conventional pattern
- Mass-like pattern
- Scar-like pattern (cicatrice)

Fig. 5.—Scarlike pattern in 60-year-old woman with adenocarcinoma.
A, Pretreatment CT scan shows spiculated lesion in right upper lobe.
B, CT scan obtained 11 months after radiation therapy shows linear area of consolidation (arrows) with volume loss and no evidence of residual tumor.
C, CT scan obtained 36 months after completion of radiation therapy shows only linear band (arrows) that resembles scar.

- Opacità lineari ampie < 1 cm
- Perdita di volume moderata o cospicua e che rimane presente alla TC nel sito del tumore quando questo è completamente o quasi completamente scomparso

consolidazione a chiazze (patchy)
e opacità a vetro smerigliato (ground glass)

Non bronchiectasie da trazione

SBRT: **Riflessioni**

None of these treatment delivery units is superior to the others, with each system clearly having its strengths and weaknesses.

The training and experience of the SBRT team are much more important than the treatment delivery unit used.

Shagal Radiosurgery 2010

CONCLUSIONI

- Da risultati preliminari pubblicati, grazie alla più estensiva prescrizione SBRT, il ruolo della RT nella malattia metastatica si è evoluto dalla palliazione dei sintomi ad un obiettivo potenzialmente curativo
- Nel sottogruppo di pazienti con metastasi solitaria studi investigazionali di dose escalation con SBRT possono essere utili per ottimizzare il controllo locale
- Nei casi con più di una metastasi specialmente se più di un organo è coinvolto I criteri di selezione per SBRT devono essere valutati con attenzione verso l'aspettativa di vita e la tossicità

Thariat et al. Bull Cancer, 2010

Timmerman et al JCO, 2007

Lartigau Et al, Radiat oncol 2012

SBRT : argomenti aperti

- Quale è il reale cut off tra la palliazione pura e l'ipotetico intento curativo nei pazienti oligometastatici
- Quale è il target ottimale e come può il radioterapista definirlo nel migliore dei modi possibili (malattia microscopica)
- Quale è il corretto timing con la cht?.
- Combinazione con i nuovi farmaci e la stereobody
- Validazione del suo ruolo attraverso trials clinici dedicati (dose, outcome)

Grazie per l' attenzione

INCLUSION CRITERIA

- Inoperable or medically unsuitable for resection
- Maximum tumour diameter < 6cm
- ≤ 3 discrete lesions
- Performance status 0-2
- Good compliance to treatment

	Dose/fraction	Number fractions	Median dose
Standard dose	25Gy	3	75 Gy
Dose reduction 10%	22.5 Gy	3	67.5 Gy
Dose reduction 20%	20.63 Gy	3	61.89 Gy
Dose reduction 30%	18.75 Gy	3	56.25 Gy

- From February 2010 and September 2011. **61 patients (74 lesions)**
- Acute toxicity was limited: **26% G2 transient transaminase elevations definitively returned to baseline.**
- No RILD. No major (grade 4 or 5) late toxicity.
- Median FU: 12 months(2-26)
- **Actuarial LC at 6, 12 and 22 months were 100%, 94.0% and 90.6%**
- **Median OS rate was 19 months**

IL VOLUME BERSAGLIO E' PERFETTAMENTE COMPRESO NELL' ISODOSE DI RIFERIMENTO DEL 90%
